

Create a simple and clear algorithm for a Movie Ticket Booking System suitable for a college BCA project.

The algorithm should include these steps:

1. Start the system.
2. Enter customer details: customer name, mobile number, and email.
3. Enter movie details: movie name, language, genre, and duration.
4. Enter show details: theatre name, show date, and show time.
5. Display the available seats.
6. Allow the customer to select one or more available seats.
7. Display the selected seats.
8. Enter the ticket price per seat.
9. Count the number of selected seats.
10. Calculate the total amount using:
$$\text{Total Amount} = \text{Number of Selected Seats} \times \text{Ticket Price}$$
11. Display the complete booking details including customer details, movie details, show details, selected seats, ticket price, and total amount.
12. End the system.

Write the algorithm in simple English with numbered steps and easy-to-understand wording.
